## ejemplo con Bundle and minify

▸ PERPLEXITY

Bundling and minification are two performance optimizations that can be applied to a web application to reduce the number of server requests and the size of requested static assets, thus improving performance <sup>1</sup> <sup>2</sup>. In C#, ASP.NET Core provides built-in support for bundling and minification of static assets using the `Microsoft.AspNetCore.Mvc`` package <sup>1</sup> <sup>2</sup>.

Here's an example of how to use bundling and minification in an ASP.NET Core web application:

1. Install the `Microsoft.AspNetCore.Mvc`` package using NuGet.
2. Create a new class in the root of your project called `BundleConfig.cs``.
3. In the `BundleConfig.cs`` file, create a new method called `RegisterBundles()`` that will register your bundles. Here's an example:

```
csharp
using Microsoft.AspNetCore.Mvc;
using Microsoft.Extensions.DependencyInjection;

public static class BundleConfig
{
    public static void RegisterBundles(IServiceCollection services)
```

Ask follow-up...

```
services.AddMvcBundle("~/bundles/css").Include(  
    "~/css/site.css",  
    "~/css/bootstrap.css");  
  
services.AddMvcBundle("~/bundles/js").Include(  
    "~/js/jquery.js",  
    "~/js/bootstrap.js",  
    "~/js/site.js");  
}  
}
```

4. In the `Startup.cs` file, add the following code to the `ConfigureServices()` method:

```
csharp  
public void ConfigureServices(IServiceCollection services)  
{  
    // ...  
  
    BundleConfig.RegisterBundles(services);  
}
```

5. In the `_Layout.cshtml` file, add the following code to include the bundles:

```
html  
<!DOCTYPE html>  
<html>
```

```
<environment include="Development">
  <link rel="stylesheet" href="/css/site.css" />
  <link rel="stylesheet" href="/css/bootstrap.css" />
  <script src="/js/jquery.js"></script>
  <script src="/js/bootstrap.js"></script>
  <script src="/js/site.js"></script>
</environment>
<environment exclude="Development">
  <link rel="stylesheet" href="/bundles/css" />
  <script src="/bundles/js"></script>
</environment>
<!-- ... -->
</head>
<body>
  <!-- ... -->
</body>
</html>
```

This code will include the individual CSS and JavaScript files in the development environment, and the bundled and minified files in other environments <sup>1</sup> <sup>2</sup>.

Third-party tools such as Gulp and Webpack can also be used to automate bundling and minification, as well as linting and image optimization <sup>1</sup>.
